TaskTrack

TASK MANAGEMENT SYSTEM - DOCUMENTATION

TaskTrack is a web-based system for managing employees, attendance, payroll, recruitment, production, and delivery. It is built with PHP and MySQL and can be run locally using XAMPP.

Key System Components

- **Dashboard and reports:** Administrative summaries of accounts and operations.
- **Accounts and access:** User account creation and management, role assignment, account activation or deactivation, employee profile linking, and profile picture management.
- **Employee tasks:** Office task assignment, progress updates, and submission of completed work for review.
- **Attendance:** Attendance recording using an Employee ID, with records available in attendance reports.
- **Payroll:** Payroll creation, review, and payment-status recording.
- **Recruitment:** Application and resume intake, applicant review, interview scheduling, and hiring workflow.
- **Production:** Production record creation, Cooking and Packaging stage assignment, progress tracking, and review of submitted work.
- **Logistics and delivery:** Shipment assignment to drivers, delivery updates, activity history, and completion review.
- **Notifications and audit history:** Task notifications and records of important system activity.

User Roles

Role	Primary Use
Administrator	Manage accounts, roles, account status, employee links, reports, and system activity.
HR	Manage employee and recruitment workflows, including applications and interview processing.
Payroll	Create and process payroll records.
Supervisor	Assign and review employee, production, and delivery tasks.
Production	View and perform production assignments. Cooking and Packaging accounts are for their respective stages.
Logistics	View assigned deliveries and update delivery progress or completion.
Employee	View personal office tasks, update progress, and submit completed work.

The Administrator creates and assigns account roles. `register.php` is not a public registration page; it redirects to the appropriate Administrator or HR user.

Local Installation

Requirements

- XAMPP with Apache, PHP, and MySQL/MariaDB
- A web browser
- The PHP mysqli extension

Fresh Installation

1. Place the project folder in the XAMPP `htdocs` directory, for example `C:\xampp\htdocs\Task management system`.
2. Open the XAMPP Control Panel and start Apache and MySQL.
3. In phpMyAdmin, create a database named `task_management_system`.
4. Import `config/install_schema.sql` into the new database.
5. Set the database configuration. For local XAMPP development, the defaults are host `localhost`, database `task_management_system`, user `root`, and no password. These defaults are not secure for production or network-accessible deployments.
6. Set `TASKTRACK_INITIAL_ADMIN_NAME`, `TASKTRACK_INITIAL_ADMIN_EMAIL`, and `TASKTRACK_INITIAL_ADMIN_PASSWORD` as process environment variables. From the project root, run:
   `php config/create_initial_admin.php`
   The password must be at least 8 characters and contain at least one number. This command only runs when the `users` table is empty. Remove the temporary environment variables afterward.
7. Open `http://localhost/Task%20management%20system/` and sign in using the Administrator account.

For production configuration and database environment variables, follow `DEPLOYMENT.md`. Do not import the installation snapshot into a database that already contains data.

Updating an Existing Database

1. Create a database backup first.
2. Determine which migrations have already been applied.
3. Apply only unapplied files in `config/migrations/`, in filename order.
4. Do not run a migration more than once. Do not apply migrations to a new database created from the installation snapshot.

Access from a Phone or Another Device on the Same Wi-Fi

1. Make sure Apache is running on the computer hosting XAMPP.
2. Connect the computer and phone to the same Wi-Fi network.
3. Find the computer IPv4 address with `ipconfig` in Command Prompt. For example, if the address is `192.168.1.5`, open `http://192.168.1.5/Task%20management%20system/` on the phone.
4. If it does not connect, first verify `http://localhost/Task%20management%20system/` works on the host computer. Allow Apache through Windows Firewall on the Private network and make sure both devices use the same Wi-Fi. The IP address may change.

LAN access is intended only for a trusted local network. Do not expose the XAMPP development server to the public internet.

Daily Use and System Files

Daily Use

1. Sign in through `index.php`; the system redirects each user to the page for their role.

2. Use the navigation on the role page to open the appropriate module.

3. In task modules, review the assignment and due date, update progress, and submit completion. Submissions may require approval by a Supervisor, or by HR/Supervisor for office tasks.

4. Sign out using the logout link when finished.

A separate attendance page is available at `attendance_form.php`. Enter the Employee ID and submit the next attendance action shown.

Database and Important Files

- `config/install_schema.sql` contains the primary tables, including `users`, `employee`, `attendance`, `payroll`, `applicant`, `supervisor`, `human_resource`, `production`, `production_assignments`, `logistics`, `delivery`, `office`, `task_notifications`, and activity/audit tables.
- `config/connection.php` - MySQL connection.
- `config/migrations/` - incremental database changes.
- `config/create_initial_admin.php` - command-line setup for the first Administrator.
- `config/*_API.php` - backend request handlers.
- `css/` and `js/` - stylesheets and browser interactions.
- `uploads/profile-pictures/` - uploaded profile pictures. Keep its `.htaccess` file when using Apache.

Security and Backups

- Change the default database credentials before using the system on a shared network or in production. Use a separate MySQL account with only the required permissions.
- Do not store database passwords or other secrets in the repository.
- Use strong passwords and do not share one login among multiple users.
- Restrict personal, attendance, payroll, and applicant information to authorized users.
- Back up the database and important uploaded files regularly. Test the restore procedure.

`config/install_schema.sql` is a schema-only snapshot; it does not restore actual application data.

System Scope and Limitations

Scope of the System

TaskTrack is a web-based system for managing employee and operational workflows. Its scope includes:

- **User accounts and access control:** Administrators create and manage user accounts, assign roles, link accounts to employee profiles, and enable or disable access. Public self-registration is not included.
- **Employee and task management:** Supervisors assign and reassign employee tasks. Employees view assigned tasks, update progress, submit completed work for review, and respond to requested changes.
- **Production tracking:** Supervisors create production records and assign Cooking and Packaging stages. Production workers view their assignments and submit work for supervisor review.
- **Logistics and delivery tracking:** Supervisors assign deliveries to drivers. Logistics users update delivery progress, submit completion with proof, and view delivery activity. Supervisors approve submissions or request changes.
- **Search and filtering:** Users search and filter tasks, employees, production work, deliveries, and reports according to role and access permissions.
- **Reporting and dashboards:** Authorized users view operational summaries and reports for attendance, tasks, production, delivery, and payroll. Some reports support date-range filtering and CSV export.
- **Attendance management:** Employees record attendance using the attendance page. Regular employee attendance supports AM and PM sessions; Logistics attendance uses a single shift. HR can review and correct attendance records.
- **HR and recruitment workflows:** HR manages employee records, leave, applications, and interview schedules.
- **Payroll management:** Payroll users prepare and review payroll records. Calculations account for recorded attendance, eligible paid leave, and unpaid leave according to current system rules.
- **Chatbot and notifications:** The chatbot provides system assistance, and notifications inform users about relevant task and review activity.
- **Database management:** Operational records are stored in a MySQL database. Role-based access limits who can view or manage information.

Limitations of the System

- Access depends on the availability of the computer, web server, database server, and local network or internet connection hosting the system.
- Users need an authorized account and the appropriate role to access protected features. Accounts are created and managed by an Administrator; public self-registration is not included.
- System performance may be affected by available hardware resources, network speed, and the volume of stored records.
- Reports and calculations depend on the accuracy and completeness of data entered into the system.
- Payroll and attendance processing follow the rules currently implemented in TaskTrack; they may not cover every company policy, holiday, or exceptional case.
- Features and integrations not included in the current version, such as connections to external payroll or accounting platforms, are outside the system scope.
